

# Explanation

- **Which tools/applications you used and why**

I going to use Photoshop which has the almost function that can help me to edit the picture.

- **How you used the features of these tools/applications**

I use the rectangle tool to draw input field and search bar.

I use horizontal tool to type text such as 'check-in, 'check-out ', 'search'.

- **Why you believe your use of tools/applications was competent**

I have some exercise in the class time and Photoshop is popular software which easier to find the tutorial in YouTube.

- **How you exported your work and why you did it that way**

I going to export a PNG file and update it in my portfolio.

- **How you managed assets during project work**

Research and aim an area (App or website)

Draw a wireframe

Double-check my idea with the lecturer

mockup

- **How you used the elements and principles in your designs**

I going to design a travel app, By the way, I did some research, almost travel app have similar home page such like the city name of you are going to, check-in and check-out date, and some useful buttons.

Overall, in my case there should have:

**First page (Home)**

Search bar:

type the city you are going, in the top of the screen

Input filed: check-in, check-out date, number of room and number of people

follow the search bar

Line:

between the all input filed (etc. Check-in and check-out), easier the user to press the button.

Button:

Try new will tells the user where just open a new hotel and you can try them first. Discount will tell the user which hotel has a lower price than normally day.

Circle buttons:

Rent a car, public transfer, and weather.

Bottom Icon:

Home, inbox, bookings and more. Draw a high recognition icon without text.

## **Second page (show all hotel result):**

Top area:

Show the city name and the number of results, there was a button which the user can change to other currency it on the top-right.

Filter:

this button includes a lot of useful function, such as price range, star rating (Standards of hotel classification), review score (user review) and more.

Work slider:

slider between work and holiday, the work option will automatically sort first the hotel more suit business, like meeting room, the holiday option will sort first the hotel have a swimming pool or kids' outdoor play equipment.

Sort:

This button can sort different type list such as lower price first or higher review first. etc.

Hotel list:

The rectangle will include the hotel name, rating star, review score, price and hotel image, and some small label to show the feature of the hotel.

Label:

Show the feature of the hotel such as free Wi-Fi, GYM, kitchenware.

### **Third page (Hotel detail)**

Top area:

Show the hotel name and address, the date of your choice.

Mid area:

The room type and the feature of the hotel.

Max number of guests, the bed type.

Bottom area:

The highlight of the hotel that the guest was given and user review.

Select button:

Select this room and go into the confirm page.

- **How your designs are consistent with conventions and existing material**

A wide range of uses of purple and blue, most of the rectangles use round corner except the label.

All borders have no edges, most rectangles use external shadows, and labels use bevel emboss

Align most (99.99%) of the rectangles and text horizontally and vertically, maintaining consistent spacing

I draw some icon such as rent car, transfer and weather.

- **What decisions you made about aesthetics and user experience**

User more high recognition icon.

Use lines to make the picture clearer and the layers more distinct

The main content is distinguished by lines and spacing.

Align most (99.99%) of the rectangles and text horizontally and vertically,  
maintaining consistent spacing

By the way, all element has color so the background I use black and white.
